Patient ID:	MQ152436	**Examination Date:**	July 27, 2026 08:42
Gender:	Male	**Report Status:**	Final
Date of Birth:	January 7, 1957	**Modality:**	CT
Referring Physician:	CHAN, CAROLINE		

Report for Computed Tomography

CT RIGHT KNEE

HISTORY: Right medial knee pain after walking. Tenderness over insertion of right MCL insertion, ?MCL sprain.

TECHNIQUE: Noncontrast CT of the right knee.

FINDINGS:

No acute fracture is demonstrated. Mild medial and lateral compartment degenerative change with small osteophytes and minimal joint space narrowing. No abnormality seen in relation to the medial or lateral collateral ligaments within the limitations of CT. No large meniscal tear or extrusion is appreciated on CT.

There is subchondral cystic change in the lateral patellar facet superiorly in keeping with full-thickness cartilage loss. There are mild to moderate degenerative changes at the proximal tibiofibular joint. Mild enthesopathy of the distal quadriceps and proximal patellar tendon insertion. Small patellofemoral osteophytes.

Trace knee joint effusion. No large Baker's cyst. No calcified intra-articular bodies. Mild vascular calcification. Enthesopathy at the posterior tibial and soleal line noted.

CONCLUSION:

Patellofemoral compartment degenerative changes with full-thickness cartilage loss in the lateral patellar facet.

Mild medial and lateral compartment degenerative changes.

No evidence of high-grade MCL injury on CT. Ultrasound or MRI would better assess the soft tissues.

Radiologist: Dr S. McDonald
